3D DESIGN

Angles in the front avoid the impact, and the sleek 3D design reduces the catching and damage risk.

ELASTIC MATERIAL

Its Elastic structure avoids interference trouble with sprocket, compared to one made of aluminum when catching the debris.

SLIM NUT

The insert nut is used on the back. Eliminating the protruding bolts and nuts, smooth head shape reduces catch during tire change.

SLIDER BOTTOM

The slider bottom has a reduced contact area in consideration to the ground clearance.

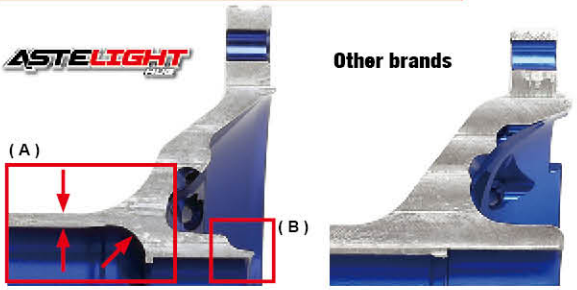
ASTELIGHT HUB

Z-WHEEL

ASTELIGHT HUB

- Racing spec hubs for real MX and ED racing.
- Compatible hubs, designed to use with OE spokes, rims and wheel spacers.
- CNC machined from durable aluminum.
- Light weight construction yet strong.
- Slant holes on the hubs to keep mud out from the hub body.
- Available in Black, Blue, H-Blue, Yellow , Green , Red and Orange colors.
- # Use OE or ZETA Wheel Spacers (P60) for installation.

DRASTIC WEIGHT REDUCTION



- ASTELIGHT HUB achieves thorough weight reduction through CNC process while keeping necessary and sufficient strength.
- The middle portion is boldly cut inside as shown in image (A), and has CNC process done even in areas not visible. Since a large force is not stressed to the portion of the oil seal in imge (B), by reducing the thickness, it contributes to weight reduction.
- The accumulation detailed efforts achieves 2/3 weight compared to other brands.

DISTANCE COLLAR

- The material uses A7075 T6 aluminum to ensure sufficient strength. ven non-visible portion reduces the weight by the thinning of the distance collar except at the ends.

HUB DESIGN

- The front hub is “concave design” that draws a gentle curved shape on the center body.
- Even with the thin designed, the curve absorbs impact from outside.
- By having shaved the inside and smoothed the outside shape, there is no waste in performance.

COMPATIBILITY WITH STOCK BEARING AND OIL SEAL

- To have compatibility with the stock parts, easy maintainance is not only the target. But to use the same size as the manufacturer importantly focuses on balance.

ASTELIGHT HUB CRF1000L

- By precision CNC machining high-strength cylindrical aluminum to 1/10th in weight, the design emphasizes strength, light weight and a beautiful appearance.
- Thinning structure on the side of the hub to keep mud out from the hub body.
- Compared to the OEM castings, weight reduction of about 500 g is achieved for front and rear set.
- Designed to be able to use in the stock condition of the normal rim and spoke.

DRC MOTO LED INDICATOR WIRING

This kit is required when flasher operates like hazard indicators after the IC relay installation.
Place these harnesses in-between the wires from the pilot lamp and the wires from the chassis.
* Some models (*3) require this kit for proper operation.
*3 ----- XR230, KSR110, KLX250, D-TRACKER-`07 etc.

Part number D45-91-051

DRC MOTO LED RESISTOR WIRE

When standard bulb flasher is replaced by LED flasher, electric consumption becomes low and stock flasher relay does not work correctly. This Resistor wire helps stabilize the electric power to the LED flasher from stock flasher relay.

: Electric power consumption level is the same as with stock flasher.
: Easy installation.
: One resistor per flasher.
* Some models (* 2) require 2 resistors.
: This harness will produce heat when used. Please install in areas where heat is not a problem.
* 2 ----- XR230, DR250R, DRZ400S/SM etc.

Part number D45-90-710

DRC MOTO LED IC RELAY for DC

Stock flasher relay is designed to work with standard bulb flashers. When the stock flasher is changed to LED flashers, the stock flasher relay does not work properly due to the difference in power consumption between the stock flasher bulb and the LED flasher. This IC Relay enables LED flashers to work in any configuration.
* Some models require the use of the stock IC relay along with this IC relay. (*1)

: Reduced electrical power usage.

Installation of the LED flashers requires special knowledge and technique.
Please contact your local dealer if you have any question upon installation.

■ Important note for using LED flasher

LED flashers have very low consumption and the stock flasher relay may not work properly. The most frequent problem, is that the LED may flash at a quick rate using stock flasher relays. Please refer to the chart below to choose our IC relay or Resistor wire for your installation.

	Electric consumption	Difficulty of installation	Parts cost	AC or DC
IC Relay	Low	Skills required	Cheap	DC
Resistor wire kit	Same as stock	Easy	Reasonable	DC/AC

* DRC IC Relay can not be used with motorcycles (XR50/100M, XLR250, WR250F/WR450F, XR650 etc) due to the AC power design. Please use Resister wire kit for AC power motorcycle.

CHAIN ADJUSTER BOLT

- By using titanium bolts the unsprung weight is reduced, and compared to stock bolts, strength is increased and visual appeal is enhanced.
- Nut is designed one size smaller, for reduced weight and compactness. And because titanium bolts to form a non-conductive coating on the surface, it will not rust.
- M8 is used by the four main Japanese manufacturers of off-road, and also some on-road manufacturers (Axle block bolt adjustment type vehicle).
- M10 is mainly used on KTM off-road models, and Husqvarna.

AXLE SHAFT

SIGNIFICANT LIGHT WEIGHT TITANIUM AXLE SHAFT

LIGHT WEIGHT

The specific gravity of Ti-6AL-4V is about 4.4. This is about 56 % with respect to the specific gravity of 7.8 of stock axle shaft using iron(SS400) and carbon steel (S45C), or chromium molybdenum steel shaft (SCM440). This means that if you manufacture the axle shaft with the same mass, 64 titanium will be able to produce about 44 % reduction in weight. The reduced weight of the axle shaft also reduces the unsprung weight and corner approaches will improve the handling and stability. In addition, the reduction of unsprung weight will not only improve the movement of the suspension, but also improve brake performance.

ULTRA STRENGTH

Strength of Ti-6AL-4V is comparable to chromium molybdenum steel (SCM435) 900 - 930 Mpa. With the higher strength axle shaft, you will be able to feel more road surface information more directly. You will be able to sense the bumpy road that could not be felt until now.

BENDING

The Young's modulus ofTi-6AL-4V is about half of iron and chromium molybdenum steel at 106 Gpa. The Young's modulus represents the rigidity and elasticity, the higher the number, the higher the rigidity. Generally, one thinks "high-strength = high rigidity," also 64 titanium has been taken for granted as high rigidity, but actually it is only half the rigidity of iron. Therefore it is easily deformed, but there is elastic deformation where a material tries to return to it's original state, and plastic deformation where deformation is permanent. 64 titanium has a wide range of elastic deformation. In other words this is "BENDING". It is this bending that produces the suspension effect, and high strength that softly transmits road surface information.

Not only Light. Not only strong. Not only flexible. If it is made of aluminum or magnesium it will be lighter than 64 titanium but it will lack strength. If it is made of chromium-molybdenum steel and nickel-chromium steel it will be stronger than 64 titanium, but it will be heavy. There is also materials having Young's modulus lower than 64 titanium, but it will not mean that there is "BENDING." 64 titanium is superior to a balance of these materials. Therefore it may be said that it is the best material for the axle shaft.

Also we must not forget the appearance of titanium. It more difficult to rust than stock shaft and chromium-molybdenum steel shaft that has a protective surface treatment. However, it does not escape corrosion where the surface is compromised for some reason. Ti-6AL-4V forms a passive film surface to prevent semi-permanent rust to form.
