ZETA ALUMINIUM THROTTLE TUBE

- Made of A6061 aluminum with hard anodized finish.
- Removable end cap design allows the use with bar end plugs or aluminum hand guards.
- Quick turn throttle tubes available for dual sport models for better acceleration.
- Special tapered inside tube design keeps the distance between the throttle tube and handlebar, greatly reducing frictional resistance which allows for smoother acceleration.

Specially designed lower bar clamp provides the option of 8 different back and forth positions in 5 mm increments. (Maximum)

One piece stabilizer is set by 4 special bolts. To securely mount handlebar, the clamp is designed to be tightened first with the 2 front side bolts, then the 2 rear side bolts.

Reinforcing ribs are positioned for maximized strength and minimized weight.

The one-piece upper bar clamp helps stabilize handlebar and prevents bar twist when falling down.

The two holes allow 2 back and forth positions of the handlebar clamp on the top clamp. Utilizing the optional lower clamp enables different handlebar height positions.

Front fork clamp area designed to securely clamp the front fork. Specially designed Front fork bolts are made of stainless to prevent corrosion.

R50 SERIES

Z-WHEEL

R50 RIM FRONT / REAR

- Real racing specification rim for ED and MX Racers.
- Made of A7050-T6 aluminum with special rim design for durability.
- Durable constructions yet light weight.
- Available wide rim lineup, latest competition bikes to older and dual sport models.
- Rims available for dual sport models, upgrade to high specification rims used by latest MX racing models.
- Available in Black, Silver, Burgundy Red, Prussian Blue and Green.

For the models with OE steel nipples, please replace them with Z-Wheel aluminum nipples.

Replace OE steel nipples with aluminum nipples to make our front and rear wheels weigh 150 g lighter than OE wheels.

One hole each for rim lock and air valve on the rim.

Z-WHEEL ZIGRAM ROTOR

- Standard sized brake rotor developed for use under extreme conditions with off road riding.
- Thick design for improved strength.
- Made of high carbon stainless steel (SUS420) for better brake feel and corrosion resistance.
- Standard type is a light weight design with holes placed based on strength analysis.
- Mud type has a solid design to keep the mud away from the rotor and prevent frictional wear of brake pads in a muddy race.

STD ROTOR

MUD ROTOR

MUD SPECIAL

Reduce wear and tear on the brake pads.

Z-WHEEL BRAKE HOSE

- PTFE inner brake hose covered stainless mesh provides better stopping power and sensitive control.
- PVC red and blue colored brake hose cover protects stainless mesh from rock and mud.
- Chrome plate coated brake banjo. Nut fitting design provides flexible brake hose installation.

DRC MOTO LED INDICATOR WIRING KIT

This kit is required when flasher operates like hazard indicators after the IC relay installation. Place these harnesses in-between the wires from the pilot lamp and the wires from the chassis.
 * Some models (*3) require this kit for proper operation.
 *3 ----- XR230, KSR110, KLX250, D-TRACKER-'07 etc.
Part number [D45-91-051](#)

DRC MOTO LED RESISTOR WIRE

When standard bulb flasher is replaced by LED flasher, electric consumption becomes low and stock flasher relay does not work correctly. This Resistor wire helps stabilize the electric power to the LED flasher from stock flasher relay.
 : Electric power consumption level is the same as with stock flasher.
 : Easy installation.
 : One resistor per flasher.
 * Some models (*2) require 2 resistors.
 : This harness will produce heat when used. Please install in areas where heat is not a problem.
 *2 ----- XR230, DR250R, DRZ400S/SM etc.
Part number [D45-90-710](#)

DRC MOTO LED IC RELAY for DC

Stock flasher relay is designed to work with standard bulb flashers. When the stock flasher is changed to LED flashers, the stock flasher relay does not work properly due to the difference in power consumption between the stock flasher bulb and the LED flasher. This IC Relay enables LED flashers to work in any configuration.
 * Some models require the use of the stock IC relay along with this IC relay. (*1)
 : Reduced electrical power usage.
 : Some technical skills required for installation.
 : One IC relay required for each bike.
 : Flasher pilot light can not be used with position light when installed on XR250.
 : If the flasher operates like hazard indicators after installation, indicator lamp wiring kit is required.
 : Works on 12V DC.
 Can not be used with WR250F/450F
 *1----- RMX250S, DRZ400S/SM etc.
Part number [D45-69-830](#)
 Installation of the LED flashers requires special knowledge and technique. Please contact your local dealer if you have any question upon installation.

Important note for using LED flasher

LED flashers have very low consumption and the stock flasher relay may not work properly. The most frequent problem, is that the LED may flash at a quick rate using stock flasher relays. Please refer to the chart below to choose our IC relay or Resistor wire for your installation.

	Electric consumption	Difficulty of installation	Parts cost	AC or DC
IC Relay	Low	Skills required	Cheap	DC
Resistor wire kit	Same as stock	Easy	Reasonable	DC/AC

* DRC IC Relay can not be used with motorcycles (XR50/100M, XLR250, WR250F/WR450F, XR650 etc) due to the AC power design. Please use Resistor wire kit for AC power motorcycle.

MATERIAL

The performance of INVISTA's COOLMAX® fabric is inherent in the structure itself. The specially engineered fibers allow fabric designers to create high-performance fabrics that are soft, breathable, and moisture wicking.

INVISTA's THERMOLITE® fabric and insulation provides warmth and comfort without weight, even when wet. Because it is comfortable and lightweight, THERMOLITE® fabric and insulation allows freedom of movement making it the perfect layer. Its hollow-core fibers trap in air for greater insulation for light, yet heavy-duty performance.

[Design]

Rounded edge design for less stress concentration and rigidity.

[Rigidity Balance]

Top bridge body is flexible when the bike is deeply banked for smooth front fork movement.

[Factory Look]

Recent light weight design used on Moto GP and WSBK race bikes.

[Light weight design]

Super light weight design, but still provides great rigidity balance. RSV4 stock top bridge weight = 534 g, ZETA top bridge = 494 g. ZETA is 40 g lighter than stock RSV4 top bridge.

- High quality light weight titanium bolts, nuts, washers and pivot pins available from ZETA.
- Brake disc bolt kit and sprocket kit available for specific models.
- Made of hot forged Ti-6AL-4V for a durable and extremely light weight-product.
- High precision CNC machined bolt and nut head, head size is one size-smaller than industrial standard for reduced weight.

Hot forging, CNC machining, thread rolling

ZETA titanium product is designed to be light weight with no decoration. Titanium products are not only machined but also hot forged to provide more tensile strength than material strength. Bolt and nut are designed with a smaller CNC machined head for a lighter design.

Titanium type and strength difference between other material.

Pure Titanium	Lower price than other titanium alloy, great corrosion resistance, but less strength.
Alfa alloy	Great creep resistance and welding work, but bad workability.
Beta alloy	Most durable titanium alloy, easy workability, but high production cost.
Alfa beta alloy	Great durability, ductility, toughness and workability. Zeta Titanium product is made of this material, Ti-6AL-4V.

Ti-6AL-4V

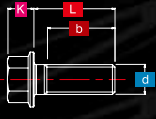

ZETA titanium products are made of Ti-6AL-4V. This chemical notation means this titanium includes 6% aluminum (AL) and 4% vanadium (V). This material is light weight and durable. It is used in aircraft and space industries, nuclear industry, industrial turbine, race car and motorcycle etc.

CHAIN ADJUSTER BOLT

- By using titanium bolts the unsprung weight is reduced, and compared to stock bolts, strength is increased and visual appeal is enhanced.
- Nut is designed one size smaller, for reduced weight and compactness. And because titanium bolts to form a non-conductive coating on the surface, it will not rust.
- M8 is used by the four main Japanese manufacturers of off-road, and also some on-road manufacturers (Axle block bolt adjustment type vehicle).
- M10 is mainly used on KTM off-road models, and Husqvarna.

AXLE SHAFT

**SIGNIFICANT LIGHT WEIGHT
TITANIUM AXLE SHAFT**

LIGHT WEIGHT

The specific gravity of Ti-6AL-4V is about 4.4. This is about 56 % with respect to the specific gravity of 7.8 of stock axle shaft using iron (SS400) and carbon steel (S45C), or chromium molybdenum steel shaft (SCM440). This means that if you manufacture the axle shaft with the same mass, 64 titanium will be able to produce about 44 % reduction in weight. The reduced weight of the axle shaft also reduces the unsprung weight and corner approaches will improve the handling and stability. In addition, the reduction of unsprung weight will not only improve the movement of the suspension, but also improve brake performance.

ULTRA STRENGTH

Strength of Ti-6AL-4V is comparable to chromium molybdenum steel (SCM435) 900 - 930 Mpa. With the higher strength axle shaft, you will be able to feel more road surface information more directly. You will be able to sense the bumpy road that could not be felt until now.

BENDING

The Young's modulus of Ti-6AL-4V is about half of iron and chromium molybdenum steel at 106 Gpa. The Young's modulus represents the rigidity and elasticity, the higher the number, the higher the rigidity. Generally, one thinks "high-strength = high rigidity," also 64 titanium has been taken for granted as high rigidity, but actually it is only half the rigidity of iron. Therefore it is easily deformed, but there is elastic deformation where a material tries to return to its original state, and plastic deformation where deformation is permanent. 64 titanium has a wide range of elastic deformation. In other words this is "BENDING". It is this bending that produces the suspension effect, and high strength that softly transmits road surface information.

Not only Light. Not only strong. Not only flexible. If it is made of aluminum or magnesium it will be lighter than 64 titanium but it will lack strength. If it is made of chromium-molybdenum steel and nickel-chromium steel it will be stronger than 64 titanium, but it will be heavy. There are also materials having Young's modulus lower than 64 titanium, but it will not mean that there is "BENDING." 64 titanium is superior to a balance of these materials. Therefore it may be said that it is the best material for the axle shaft.

Also we must not forget the appearance of titanium. It is more difficult to rust than stock shaft and chromium-molybdenum steel shaft that has a protective surface treatment. However, it does not escape corrosion where the surface is compromised for some reason. Ti-6AL-4V forms a passive film surface to prevent semi-permanent rust to form.

Material	Material symbol and heat treatment	Tensile strength (T/Mpa)	Young's modulus (E/Gpa)	Specific gravity
Roller steel for general structure	SS400(Annealing)	450	206	7.87
Carbon steel for mechanical structure	S45C(Normalizing)	570 or more	205	7.83
Chromium-molybdenum steel	SCM440(Tempering quenching)	980 or more	206	7.86

CBR250RR

[Design]

Rounded edge design for less stress concentration and rigidity.

[Rigidity Balance]

Top bridge body is flexible when the bike is deeply banked for smooth front fork movement.

[Factory Look]

Recent light weight design used on Moto GP and WSBK race bikes.

[Light weight design]

Super light weight design, but still provides great rigidity balance. RSV4 stock top bridge weight = 534 g, ZETA top bridge = 494 g. ZETA is 40 g lighter than stock RSV4 top bridge.

[Ti-6AL-4V bolt]

Clamp bolt is made of titanium for light weight and stable tightening torque.

Aim for fastest lap!

- High quality light weight titanium bolts, nuts, washers and pivot pins available from ZETA.
- Brake disc bolt kit and sprocket kit available for specific models.
- Made of hot forged Ti-6AL-4V for a durable and extremely light weight-product.
- High precision CNC machined bolt and nut head, head size is one size-smaller than industrial standard for reduced weight.

Hot forging, CNC machining, thread rolling

ZETA titanium product is designed to be light weight with no decoration. Titanium products are not only machined but also hot forged to provide more tensile strength than material strength. Bolt and nut are designed with a smaller CNC machined head for a lighter design.

Ti-6AL-4V

ZETA titanium products are made of Ti-6AL-4V. This chemical notation means this titanium includes 6% aluminum (AL) and 4% vanadium (V). This material is light weight and durable. It is used in aircraft and space industries, nuclear industry, industrial turbine, race car and motorcycle etc.

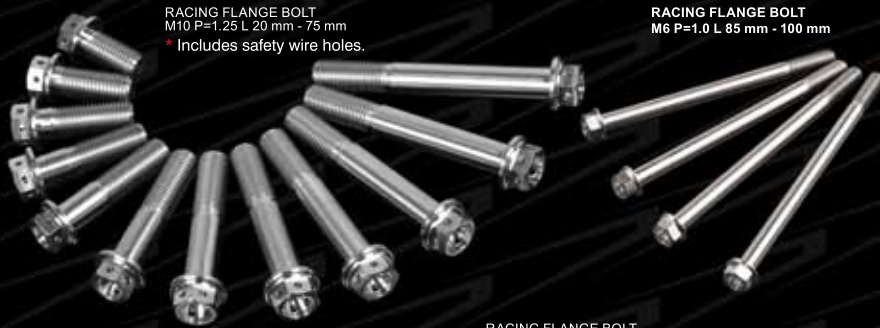

Titanium type and strength difference between other material.

Pure Titanium	Lower price than other titanium alloy, great corrosion resistance, but less strength.
Alfa alloy	Great creep resistance and welding work, but bad workability.
Beta alloy	Most durable titanium alloy, easy workability, but high production cost.
Alfa beta alloy	Great durability, ductility, toughness and workability. Zeta Titanium product is made of this material, Ti-6AL-4V.

CHAIN ADJUSTER BOLT

- By using titanium bolts the unsprung weight is reduced, and compared to stock bolts, strength is increased and visual appeal is enhanced.
- Nut is designed one size smaller, for reduced weight and compactness. And because titanium bolts to form a non-conductive coating on the surface, it will not rust.
- M8 is used by the four main Japanese manufacturers of off-road, and also some on-road manufacturers (Axle block bolt adjustment type vehicle).
- M10 is mainly used on KTM off-road models, and Husqvarna.

AXLE SHAFT

**SIGNIFICANT LIGHT WEIGHT
TITANIUM AXLE SHAFT**

LIGHT WEIGHT

The specific gravity of Ti-6AL-4V is about 4.4. This is about 56% with respect to the specific gravity of 7.8 of stock axle shaft using iron (SS400) and carbon steel (S45C), or chromium molybdenum steel shaft (SCM440). This means that if you manufacture the axle shaft with the same mass, 64 titanium will be able to produce about 44% reduction in weight. The reduced weight of the axle shaft also reduces the unsprung weight and corner approaches will improve the handling and stability. In addition, the reduction of unsprung weight will not only improve the movement of the suspension, but also improve brake performance.

Not only Light. Not only strong. Not only flexible. If it is made of aluminum or magnesium it will be lighter than 64 titanium but it will lack strength. If it is made of chromium-molybdenum steel and nickel-chromium steel it will be stronger than 64 titanium, but it will be heavy. There are also materials having Young's modulus lower than 64 titanium, but it will not mean that there is "BENDING." 64 titanium is superior to a balance of these materials. Therefore it may be said that it is the best material for the axle shaft.

Also we must not forget the appearance of titanium. It is more difficult to rust than stock shaft and chromium-molybdenum steel shaft that has a protective surface treatment. However, it does not escape corrosion where the surface is compromised for some reason. Ti-6AL-4V forms a passive film surface to prevent semi-permanent rust to form.

ULTRA STRENGTH

Strength of Ti-6AL-4V is comparable to chromium molybdenum steel (SCM435) 900 - 930 Mpa. With the higher strength axle shaft, you will be able to feel more road surface information more directly. You will be able to sense the bumpy road that could not be felt until now.

BENDING

The Young's modulus of Ti-6AL-4V is about half of iron and chromium molybdenum steel at 106 Gpa. The Young's modulus represents the rigidity and elasticity, the higher the number, the higher the rigidity. Generally, one thinks "high-strength = high rigidity," also 64 titanium has been taken for granted as high rigidity, but actually it is only half the rigidity of iron. Therefore it is easily deformed, but there is elastic deformation where a material tries to return to its original state, and plastic deformation where deformation is permanent. 64 titanium has a wide range of elastic deformation. In other words this is "BENDING". It is this bending that produces the suspension effect, and high strength that softly transmits road surface information.
